

# Protein Prediction I Exercise

---

## MILESTONE 3

### CGI IMPLEMENTATION

# Integrated approach

- Write your cgi-script such that it delivers the html-form on first call (through client.py), and then calls itself (through the form-action):
- I.e. test in your cgi program, whether the cgi 'upload' variable is already initiated.
- If not: Return the html form, which then calls the script a second time (through the form-action), this time with the 'upload' variable initiated
- Put it into your cgi-bin, no need for a separate html file
- The URL should look like this:

`http://i12k-biolab01.informatik.tu-muenchen.de/~ppgroupxx/cgi-bin/ppgroupxx.cgi`
